SLURM

- http://docs.ilifu.ac.za/#/getting_started/submit_job_slurm
- Login node (job submission & management)
 - Where you land when you log in (also known as "head node")
 - Run SLURM commands/submit jobs, but not software/heavy processes
- Compute nodes
 - Where your processes run (also known as "worker nodes")

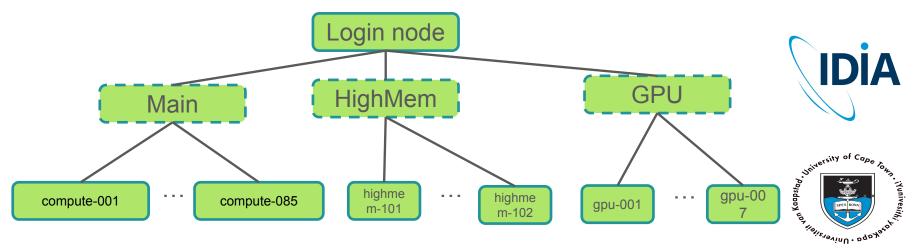

SLURM

- http://docs.ilifu.ac.za/#/tech_docs/running_jobs?id=_4-specifying-resources-when-running-jobs-on-slurm
- Partitions (other than Jupyter) see with 'sinfo':
 - Main: 85 nodes (currently), each w/ 32 CPUs, 232 GB (usable) RAM
 - HighMem: 2 nodes, w/ 32 CPUs, 503 GB (usable) RAM + 96 CPU 1.5 TB RAM
 - GPU: 7 nodes (P100, V100,..), each w/ 24-48 CPUs, 232-354 GB (usable) RAM

- Oxford definition for parallel processing
 - a mode of operation in which a process is split into parts, which are executed simultaneously on different processors attached to the same computer [or different computers attached to the same cluster].
 - A cluster includes many connected nodes, each with its own RAM & CPUs
 - A node = single computer / server / VM / machine / box

• The work is partitioned into smaller jobs, sometimes with a partition of the dataset

What is a program?

ilifu

- Set of discrete instructions
- Carried out sequentially
- Example: print average grade of a class
- $1. \quad total = 0$
- for grade in grades: total = total + grade
- 3. average = total / number_of_grades
- 4. print(average)

Parallel execution of a program

- Partition grades into 2:
- 1. total = 0
- 2. for grade in 1/2 grades:

 average1 = total / number_of_grades

- 1. total = 0
- 2. for grade in 1/2 grades:

 average2 = total / number of grades

Combine results

- Executing portions of program simultaneously
- Possible when we have many processors (cores/CPUs)
- Capacity dependent on structure of both hardware AND software
- Requires overall control/coordination mechanism
 - i.e. message passing

Parallelism on the cluster

ilifu

- A cluster includes many connected nodes
- Each node has RAM and multiple cores
- Work of job is partitioned into smaller jobs
- Sometimes with a partition of the data

ilifu

- Can be achieved on a single machine / node
 - Distributes work over many CPUs
 - Typically implemented using threads / OpenMP
- Or over multiple machines / nodes
 - Distributes work over many tasks, over 1+ nodes
 - Each given amount of memory to use
 - Generally requires a cluster
 - Typically implemented using OpenMPI
 - Requires a message passing interface (MPI) wrapper
 - mpirun, srun (SLURM), mpicasa (CASA 5)
 - Version of wrapper outside and inside container / venv must match
- Managed on ilifu by SLURM

- Implementing a normal job in SLURM
 - Will only use 1 CPU, 1 task, and 1 node
 - Default for many processes
- Implementing an OpenMP job in SLURM
 - Need to use >1 CPU, while nodes & tasks must be 1 (unless also using MPI)

- cpus-per-task (not inherited from #SBATCH)
- May need to export OMP_NUM_THREADS
- Implementing an MPI job in SLURM
 - Need to use >1 task, while nodes and CPUs can be 1
 - nodes, ntasks-per-node, cpus-per-task
 - Best to wrap singularity in MPI call
- Cannot exceed 32 CPUs (or tasks) per node

SLURM – serial and multi-CPU jobs

If code is serial, i.e. doesn't use OpenMP or MPI, increasing CPUs or nodes will not decrease execution time

```
#SBATCH --nodes=1
#SBATCH --ntasks-per-node=1
#SBATCH --cpus-per-task=1
module add openmpi
python myscript.py
```

Using multiple CPUs within a node with OpenMP, where N is an optional number of CPUs (utilised by myscript.py)

```
#SBATCH --nodes=1
#SBATCH --ntasks-per-node=1
#SBATCH --cpus-per-task=N
#SBATCH --mem-per-cpu=XGB
module add openmpi
python myscript.py
```

Note: The maximum number of CPUs per node (32) will not always give the maximum speedup

SLURM – multi-task and multi-node jobs

Can also specify tasks or tasks per node

```
#SBATCH --ntasks=N
#SBATCH --cpus-per-task=1
#SBATCH --mem=XGB
module add openmpi
mpirun python myscript.py
```

CBIO

Above example doesn't require knowledge of number of node's CPUs: below one does

```
#SBATCH --nodes=1
#SBATCH --ntasks-per-node=N
#SBATCH --cpus-per-task=1
#SBATCH --mem=XGB
module add openmpi
mpirun python myscript.py
```

SLURM – multi-task and multi-CPU jobs

Using multiple nodes with MPI

```
#SBATCH --nodes=N
#SBATCH --ntasks-per-node=n
#SBATCH --cpus-per-task=1
#SBATCH --mem=XGB
module add openmpi
mpirun python myscript.py
```

- Note: Need to consider that internode communication is slower than intranode communication
- --mem is memory per node, so N times XGB allocated overall (usable by some software)
- Using multiple nodes with MPI as well as multiple cores within node with OpenMP (utilised by myscript.py)

```
#SBATCH --ntasks=N
#SBATCH --cpus-per-task=n
module add openmpi
mpirun python myscript.py
```

SLURM – dependencies

- Allows jobs to be scheduled for running, based on the status of a previous job
 - e.g. only begin a particular job once previous one successfully completes

```
$ sbatch -d afterok:882242 --kill-on-invalid-dep=yes another_job.sh
#submit another_job.sh to SLURM queue, to begin after jobID 882242
successfully completes (exit code 0), or cancel the job if jobID 882242 fails
```

```
$ sbatch -d afterany:882242:882243 another_job.sh #submit another_job.sh to SLURM queue, to begin after jobIDs 882242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242 & 82242
```

Best practices

- Don't run software / heavy processes / scp on the login node
 - Only submit jobs and run SLURM commands (sbatch, srun, squeue, etc)
 - Use transfer.ilifu.ac.za to transfer data (external/internal), not login node
- Before running a large job, identify the available resources
 - Use sinfo. Don't hog the cluster. Reduce your allocation if possible
 - Increase likelihood of jobs running with less memory and less walltime
- Use sbatch (srun / screen / tmux / mosh are volatile)
- Cleanup files that aren't needed
 - Old raw data, temporary products, /scratch data, etc
- Don't place large files in your home directory (/users)
- Use Singularity (you cannot install software on the nodes)

THANK YOU
